

GRAEME WHITE, FROM ATLAS FIRE & SECURITY, HIGHLIGHTS HOW THE BELFAST-BASED COMPANY IS MEETING FIRE SUPPRESSION NEEDS THROUGH ITS PARTNERSHIP WITH FIKE PROTECTION SYSTEMS...

Fire suppression solutions from Atlas Fire & Security

Atlas Fire & Security is respected for the strategic partners the company works with and when it comes to fire suppression equipment this is no different. The Belfast-based company is the sole representative in Northern Ireland for Fike Protection Systems, forming an important part of the fire suppression equipment specialist's distribution network.

"At Atlas Fire & Security our main strength is that we can tailor a system to meet a customer's exact needs and Fike Protection Systems fits perfectly within this," explained Graeme White, Sales Manager, Atlas Fire & Security,

"We are the leading independent, open protocol supplier and maintainer of fire and security products in the province and with that we have added pressure in the future as our customers are in a position to speak to other companies.

"But we have full confidence in our our service and our products and that is why working with such respected names such as Fike Protection Systems is so important."

And, as Mark Austin, Managing Director of Fike Protection Systems, explained, it is a strong partnership aimed at providing customers with the highest standards of service.

"Although Atlas has been a Fike distributor since its formation in 2004, the relationship between the key people within each company stretches back much further through various other companies within the industry and forms the basis of a solid, trusting and long-lasting partnership," he said. "This has been instrumental in securing significant prestige projects in the telecommunications industry and, more recently, within the public health sector." Innovation has always been at the forefront of success for Atlas and that also continues to be the key focus for Fike Protection Systems.

Atlas Fire & Security is set to launch Fike Protection Systems' Impulse range of equipment for chemical clean agents utilising DuPont's FM-200™ or FE-25™ extinguishant gases.

Using Fike's patented bursting disc technology, the Impulse valve offers an unimpeded flow from the cylinder straight through the valve in order to minimise pressure drop and therefore to ensure maximum efficiency for the delivery of agent into the protected space and to maximise the flexibility of the piping designs.

IMPULSE

Impulse will offer the benefit of an 'on-board' direct-acting solenoid which removes the need for remote nitrogen pilot actuation. Impulse has also been engineered to allow the firing of multiple cylinders from a single firing circuit without the need to increase the current output of a typical extinguishant panel. Even with these technological advances the Impulse range will be targeted to not only be technically advantageous, but commercially competitive for the user.

FM-200 has long been globally accepted as the leading clean agent extinguishant and Fike has provided systems to protect some irreplaceable historical items such as the Declaration of Independence and 'Old Glory', the original star-spangled banner in the USA and, further afield, Fike clean agent systems have also been used to protect what is recognised as the world's first Bible at the Baha'i Centre in Israel, and the massive new Justice Ministry complex being built just outside Istanbul.

Also utilising the same clean agents are the Fike Fireraser range of fire suppression systems, providing 'big protection for small spaces'. Fireraser offers a high quality but economic method of protecting specific critical risks such as storage carousels, electrical cabinets, switchgear, small PABX and telecommunications enclosures, and many other applications. The Fireraser range will be expanded to include other options in the future, increasing it's versatility still further.

Mark added, "Integral to Fike's success is the close relationship that we have been developed with distributors and we are proud to have Atlas

Fire and Security as our sole distributor in Northern Ireland.

"Fike systems are the fire protection of choice for many blue-chip companies and are used to protect many valuable and irreplaceable assets. Together with the sophisticated electronic system and the customer-focussed service offered by Atlas Fire and Security, the user can be sure of a compliant, effective and commercially viable solution to their needs."
